Master Prompt Changelog v2026-10-16

ADDED Part G (user-approved): concrete high-volatility regime (VIX>20 OR MOVE>110/>1y P80 OR last 3 macro releases in tails); middle scenario capped at 45% in high regime with redistribution to tails + renormalisation; scenarios defined on decision-relevant variables (core, control group) not headline; TSM lesson — Beat split into sector-tailwind vs sector-headwind. Implemented in pipeline/calibration.py and all pre-event builders; logged in Model Evolution (included in this version folder). v2026-10-14 preserved.
